

I always assumed learning styles were credible since I'd never heard anything opposing them. But if I were to believe Cindi May's paper, then it seems that learning styles don't actually matter for better learning comprehension and that they are just a way for individuals to feel a sense of individuality and be able to do less work. So supposedly the real way to improve learning comprehension is through old tried and true techniques, like taking practice tests. I would rather see more proof since I have nothing but the word of a writer and the word of past teachers, but both sides sound very plausible either way.
